Frontispiece: facing page

In the summer of 2011, GEUS carried out extensive reconnaissance work in South-East Greenland. The aim is to assess the mineral potential of the region, which is one of the least known regions of Greenland. The geologist is panning stream sediments in order to separate heavy minerals, possibly including gold. Photograph: Jakob Lautrup.

7 Review of Survey activities 2011

F.G. Christiansen

9 Nano-quartz in North Sea Danian chalk

H. Lindgreen and F. Jakobsen

13 Geology of the Femern Bælt area between Denmark and Germany

E. Sheldon, P. Gravesen and H. Nøhr-Hansen

17 Rock-cored drumlins on Bornholm, Denmark

P.R. Jakobsen

21 Methane distribution in Holocene marine sediments in the Bornholm Basin, southern Scandinavia

J.B. Jensen and R. Endler

25 Natura 2000 habitat mapping in Kattegat, Denmark: an example from Læsø Trindel

Z.K. Al-Hamdani and L.G. Addington

29 Early Holocene sea-level changes in Øresund, southern Scandinavia

O. Bennike, M.S. Andreasen, J.B. Jensen, M. Moros and N. Noe-Nygaard

33 Cliff collapse at Stevns Klint, south-east Denmark

S.A.S. Pedersen and T. Damholt

37 Shallow geothermal energy in Denmark

T. Vangkilde-Pedersen, C. Ditlefsen and A.L. Højberg

41 Efforts to include geological and geodetic observations in the assessment of earthquake activity in Denmark

S. Gregersen and P.H. Voss

45 Results of monitoring groundwater above the natural gas underground storage at Stenlille, Denmark

T. Laier

49 Groundwater protection in Denmark and the role of water supply companies

J.D. Petersen and L.F. Jørgensen

GEUS working areas 2011.
Orange areas are covered in this volume.

53 Anorthosites in Greenland: a possible raw material for aluminium?

C. Knudsen, J. Wanvik and H. Svahnberg

57 From 3D mapping to 3D modelling: a case study from the Skaergaard intrusion, southern East Greenland

K. Svennevig and P. Guarnieri

61 Geological assessment of the East Greenland margin

M.B.W. Fyhn, T.M. Rasmussen, T. Dahl-Jensen, W.L. Weng, J.A. Bojesen-Koefoed and T. Nielsen

65 New evidence for possible generation of oil off south-western Greenland

T. Laier and H.P. Nytoft

69 Methane and possible gas hydrates in the Disko Bugt region, central West Greenland

N. Mikkelsen, T. Laier, T. Nielsen, A. Kuijpers and N. Nørgaard-Pedersen

73 Ablation observations for 2008–2011 from the Programme for Monitoring of the Greenland Ice Sheet (PROMICE)

R.S. Fausto, D. van As and the PROMICE project team

77 Testing of an automatic earthquake detection method on data from Station Nord, Greenland

N. Karamzadeh, P.H. Voss and G.D. Javan

81 The Cenozoic Song Hong and Beibuwan Basins, Vietnam

M.B.W. Fyhn, H.I. Petersen, L.H. Nielsen, T.C. Giang, L.H. Nga, N.T.M. Hong, N.D. Nguyen and I. Abatzis

85 Rock phosphate and lime for small-scale farming in Tanzania, East Africa

P. Kalvig, N. Fold, J.B. Jønsson and E.E. Mshiu

Review of Survey activities 2011

Flemming G. Christiansen

Deputy Director

2011 was a good year for the Geological Survey of Denmark and Greenland (GEUS) with fruitful discussions of strategies, handling of challenges posed to our society that has strong needs for growth and investments, and consequently for developing new projects for the future within the many fields where GEUS is involved.

GEUS has been through a long – but very constructive – process of putting together a new strategy that reflects the changes in society and new demands from many different stakeholders. This new strategy, ‘Geology for society – knowledge for growth and welfare’, covers the period up to 2020 and is based on an analysis of key driving forces such as transition from fossil fuel to sustainable energy, adaptation to changing climate conditions, need for water resources locally and globally, and international competition for critical minerals. The strategy includes a number of specific strategic topics. As these topics have been discussed between scientists and management over a long period and in some cases are related to new and on-going Survey projects, these topics are reflected in many of the papers in this year’s issue of Review of Survey activities.

The reader will find contributions covering several of our new strategic topics such as: ‘Past and future climate’, ‘Geology across land and sea’, ‘Geology in the public arena’, ‘Water resources under pressure’, ‘Oil and gas supply and transition to green energy’ and ‘Geothermal energy and heat storage’, as well as papers on other subjects from GEUS’ very broad project portfolio. Some of them describe specific, short projects, and others focus on results from some of our long-term monitoring projects on for example groundwater, gas storage, ice and earthquakes.

GEUS’ activities and research in Denmark cover many different subjects such as fossil fuel and renewable energy, water, climate history and monitoring and adaptation to climate changes, nature protection, input to large infrastructure projects and data management.

Chalk is the main oil reservoir in the Danish part of the North Sea and understanding its mineralogy and diagenesis has crucial implications for production parameters. One paper proposes a new model for the formation of flint from studies of nano-quartz.

As part of planning the fixed link across Femern Bælt between Denmark and Germany, GEUS has been involved in geological and geotechnical investigations. Results of a multidisciplinary biostratigraphic study of pre-Quaternary deposits (especially Paleocene and Eocene) are summarised here.

Although the surface morphology of Denmark is well mapped and described in detail, there is still room for new observations and reinterpretation of some glacially formed features like rock-cored drumlins from Bornholm that are described for the first time.

Understanding methane distribution in young marine sediments is important for long-term use and protection of areas such as the Baltic Sea. GEUS has been partner in the Baltic Gas project with a key role to map the occurrence of free gas, to quantify the flux of gas and to study the processes and parameters governing methane generation and consumption. Natura 2000 is a network of nature protection areas under the Habitats Directive of the European Union. Some results from mapping of a Natura 2000 area with bubbling reefs in the inner Danish waters are presented in this volume. Another paper describes how Øresund became a strait between 8000 and 9000 years ago due to sea-level rise after an earlier history of being dry land with some bogs and lakes, and later a fjord.

The coastal cliff Stevns Klint is a classical locality for field trips, especially for studying the world’s best exposed Cretaceous–Tertiary boundary, but also for the beautiful scenery. For this reason an understanding of the risks of cliff collapse is crucial, and an analysis of the different collapse types including volumetric considerations based on photogrammetric studies is given in one of the papers.

With a strong Danish ambition to reduce the dependence on fossil fuel by using renewable energy sources, shallow geothermal energy can be economically competitive. One paper introduces this concept with comments on exploitation, modelling and groundwater protection. The latter is very important in Denmark where almost all drinking water comes from groundwater. The Danish policy on this topic and the role of the authorities and water supply companies are discussed. GEUS is also involved in long-term monitor-

ing of groundwater above the gas storage facility at Stenlille on Sjælland. There has been no evidence of leakage through the geological barriers, and only one short incident with traces of gas from an injection well. Earthquake activity is low in an intra-plate region like Denmark, but prediction of seismicity is important, and the question whether geological and geodetic observations should be included in the assessment is discussed.

In 2011 there was a high level of field activities in Greenland with a major mapping and geochemical programme in South-East Greenland, a large field and shallow-core drilling programme of poorly known Cretaceous sediments in North-East Greenland and the EAGER cruise offshore North-East Greenland, which was part of the Danish Continental Shelf Project. Results from these large projects will be presented later; in this issue results from other completed and on-going projects are presented.

This volume also contains a discussion of the possibility to use anorthosite from Greenland as a future raw material for aluminium instead of bauxite. Based on regional knowledge and geochemical data, it is suggested that the Fiskensæt complex is especially interesting. 3D mapping and modelling is high on the agenda in the new GEUS strategy in both Denmark and Greenland. Different methods are used in the crystalline areas of Greenland, for sedimentary basins or for Quaternary deposits in Denmark. A case study from the Skaergaard intrusion in southern East Greenland is presented.

In Greenland, the Bureau of Minerals and Petroleum in Nuuk is preparing licensing rounds offshore North-East

Greenland for 2012 and 2013, and part of the regional preparation for this work is described. There is a high level of exploration activities throughout the West Greenland shelf in these years, and one paper brings a case study of bitumen from crystalline rocks in South Greenland.

Climate models predict a marked warming in the Arctic that may lead to the release of large amounts of methane bound in permafrost areas or in gas hydrates. The background of and some preliminary results from a scientific cruise to Disko Bugt in 2011 are related. The important monitoring programme of the Greenland Ice Sheet (PROMICE) continues to develop, and a paper summarises the results of ablation observations from 2008 to 2011. GEUS takes part in operating many seismic stations in Denmark (5) and Greenland (18), and it is very time-consuming to analyse all data manually. Test of an automatic method is described in another paper, and although the method is efficient, manual processing is still required to detect all earthquakes and for quality control purposes.

GEUS works in many different countries with many different types of projects. The last two papers in this issue are about Vietnam and Tanzania. GEUS has been active in Vietnam together with our sister organisation Vietnam Petroleum Institute and universities in Hanoi for almost twenty years. In Tanzania a Geocenter Denmark project has studied the possibilities of restoring soil fertility by using locally quarried rock phosphate and lime.
